Pseudo-Science Analysis Paragraph

The article is structured in a format of bullet points followed by explanations to provide a sense of order. However, the use of gobbledygook in multiple parts, like “colloidal solutions containing nanoparticles of measurable (upto 200c potency) source material and glass-derived silica crystals heterogeneously dispersed in water-ethanol solution prepared by a pharmacological process of potentisation in a type-2 borosilicate (96.4%) neutral glass vial” and “the metaphysical doctrine that living organisms possess a non-physical bio-energetic self-powered inner inborn biological strength that gives them the property of life” overwhelms the reader by a lot of unfamiliar terms and the unclear logic. This will make the reader confuse, and thus believe in the bullet point mentioned beforehand without a clear understanding of what the point is actually talking about. The article also makes use of many “i.e.” examples and explanations. However, the content provided as the explanation is as confusing as the parts being explained. This method forms a false impression that the terms are supported by these “supporting details”, and thus makes the reader believe in its opinion.
